

Sustainability Report

At SENIS, we understand that it is our social responsibility to enhance our corporate value through innovation and sound business practices and contribute to developing a sustainable society. We hold ourselves responsible to all stakeholders including our customers, shareholders, employees and business partners. We are also accountable to our society, and to the Earth in which we operate.

At SENIS, we will continue to take a long-term view of our business with our strong commitment to generate sustainable social value, in addition to creating more economic values on the global market.

SENIS is developing advanced sensors and instruments for measuring magnetic fields and electric currents. Our products and innovations support the world development through advanced magnetic and current measurement applications in industry and physics laboratories. SENIS also engages in various R&D projects supported by the European Commission. The R&D project results contribute to a socio-economic impact and a sustainable development of our society.

We support education in science, technology and engineering. SENIS works in close collaboration with Universities and academic institutions. We publish articles in peer reviewed journals and present our work at scientific conferences.

We recognize that SENIS's business cannot continue to exist without a sustainable natural environment and a peaceful society. This motivates us to work tirelessly for the environment, human rights, and diversity. In addition, we also want to contribute to the safety in the increasing levels of vehicle automation with our newly developed magnetic and current sensors. We believe these efforts will help to achieve the sustainable development goals, which is our global society's common agenda.

At SENIS, we remain committed to engaging in ongoing projects and close dialogue with our stakeholders towards a more sustainable world.
